Vernon Workshop Drought/Frost Tool Exercises

1. Using the Drought Tool input a BGC unit moisture regime tree species combination where you feel you may have problems with drought dieback or subsequent drought stressed related beetle problems.

   Note the risk ratings for the different time periods in to the future.

2. Using the Drought Tool input a BGC unit moisture regime combination for a site where you feel you may have issues with mortality of planted seedlings. Now look at the chart and see what species are at low to moderate risk through the rotation. Decide what species would be acceptable. Now do same combination including slope positon for Frost tool and see if changes the decision.
