

Submitting a multi-location CSV file to the CCISS tool

Locations should be saved in the format example below as a .CSV text file

ID1	lat	lon
Site01	54.05001	-122.16177
Site02	54.05021	-122.16788
Site55	54.01	-122.222
Site99	56.06929	-124.81235

Example location file format for ClimateBC and CCISS.

- **ID1** should contain unique location identifiers.
- **Lat** should be latitude in decimal degrees
- **Lon** should be longitude in negative decimal degrees (western hemisphere)

When running individual reports for each submitted location, be aware that large numbers of points will take considerable time to process.

When Points averaged over BGC is selected, a single report is generated for each BGC using all points assigned to that BGC.
