ENDED - High Streamflow Advisory – Fraser River

Issued: 12 June 2012 9:00AM

The BC River Forecast Centre is **ending** a **High Streamflow Advisory** for:

- **Fraser River from Quesnel to the ocean, including the Fraser Canyon and Lower Mainland**

The rainfall from last week has now worked its way through the Fraser River system. The Fraser River at Hope (WSC 08MF005) peaked around mid-day on Monday at 9750 m³/s. River levels are now receding, and are expected to remain around 9000-9500 m³/s through the week.

The River Forecast Centre will continue to monitor conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
