UPDATE: Flood Watch – Shuswap

Issued: 10June2012 7:00PM

The BC River Forecast Centre is **maintaining** a **Flood Watch** for:

- **Shuswap River**

River levels along the Shuswap River are elevated from several days of heavy rain. Flow on the Shuswap River at Lumby (08LC003) peaked earlier today at 246 m³/s (2-5 year flow), and flow on the Shuswap River at Enderby (08LC002) is at 390 m³/s (5-year flow).

Flow is now dropping on the Shuswap River at Lumby, and are expected to continue to decline. Flows are expected to remain elevated at the Shuswap River at Enderby, and it may be 1-2 days before there is a significant decline in river levels.

The River Forecast Centre will continue to monitor conditions and will provide updates as conditions warrant.

A **High Streamflow Advisory** means that river levels are rising or expected to rise rapidly, but that no major flooding is expected. Minor flooding in low-lying areas is possible.

A **Flood Watch** means that river levels are rising and will approach or may exceed bankfull. Flooding of areas adjacent to affected rivers may occur.

A **Flood Warning** means that river levels have exceeded bankfull or will exceed bankfull imminently, and that flooding of areas adjacent to the rivers affected will result.
