AGE SITE INDEX
Site index is the height of dominant and codominant trees at 50 years. Site index is a measure of the quality of a forest site for growing timber. Where an accurate 5 decimal site index is not available, a site index class is assigned.

4e. ESTIMATED SITE INDEX
Estimated site index is the site index value that is present, e.g. in a polygon where no site index is available but a stand which grows provides it. Associated fields in the data base are inventory type group and estimated source site.
