4d SITE INDEX
Site index is the expected mean whenever at 50 years. Mean height is the average height of trees in a stand. Height is usually measured in metres. Site index is a measure of site productivity. It is determined by measuring the height, estimated 50 is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX #
Estimated site index is derived from environmental, e.g. climatic factors, soil, topography, and other environment e.g. woody plants (shrubs). It is determined by examining various Site Series and Site Indicator species listed in Ecosystem Type Group and SI/Estimated source code.

Line 5 - Vegetation Height:
