4d SITE INDEX
A 50 is assumed to be repeat mats referenced at 50 years Breast Heights. It is based on the age and height of the tallest trees in the stand. Site index is a measure of the relationship between age and height, and is known also as a species site index.

4e. ESTIMATED SITE INDEX
SI is estimated when suitable SI trees are not present, e.g. young stands (<10yrs). It is denoted by a dash which always follows the species code. Estimates are based on Biogeoclimatic Site Group and SI Estimated source code.
