2. Polygon Number and multi-layer stand indicator (L)
3. Species Composition
   - ex: the most important layer is described as Fd (Douglas Fir) and Hw (Western Hemlock)
4. Age Class and Height Class (Site Index) for the leading species

5. Vegetated Density Class (or Non-Forest Productive Descriptor)
   - ex: a herb polygon with no distinction between forbs and graminoids, shrubs less that 2m.
6. Disturbance History & year - ex: L logged in 1978

Line 1 - History Record (Opening Number)

OGC - opening number valid for BCGS mapsheet. *non* - opening number has not been assigned

Line 2 - Polygon No. / Multilayer

VRIMS Polygon Number - ranging from one to nine digits
L - Multi-layered stand (a separate description of each layer is available in the data base...i.e. 1,2)

4d SITE INDEX
Age and height at the nearest metre, referenced at 50 years. Based on height only. SI is based on the site curves of Bruce and Schumacher (1950) for interior species and Sitka spruce, and Meyer (1961) for coastal species. Input is species and height, estimated SI is shown after, or replaces the SI.

4e ESTIMATED SITE INDEX 4
SI is estimated when subarea SI lines are not present, e.g. young stands. Input is species and age, and SI is estimated from the Site Index Curves. Age is estimated from the Biogeoclimatic Type Group and SI if alternate source code.
