This map is created from information stored digitally in the BC Geographic Warehouse. The map has been structured to display on a standard computer screen or printed on a standard colour printer. Because of this, some information portrayed may not be complete and up to date. Cadastral, administrative boundaries and the Ownership colour theme are for reference purposes only. 4d SITE INDEX

Site Index is the height of a stand mate witnessed at 50 years. Where height is not available at the age and measured from existing species. When an accurate SI cannot be obtained from measurements, a site index estimate is made by the following methods:

4e. ESTIMATED SITE INDEX

Site Index estimates are based on ecological classification, e.g. every species in a forest ecosystem has a site index value and measurements of each which always produces a theoretical index in the data base as an inventory type. Measured and estimated values are valid.
