4d SITE INDEX

Site Index is the tree/ecosite reference at 50 years Breast Height Age. SI is based on the age and height of the leading species. When an accurate SI cannot be obtained from an even aged stand, an estimate may be made.

4e. ESTIMATED SITE INDEX

SI is estimated when access SI trees cannot present, e.g. young stands (<10yrs). SI is derived by a site/Unit which always precedes it. Associated fields in the data base are inventory type (heavy cut) SI if harvest occurs later.
