4d SITE INDEX

Site index is the mean metric referenced at 50 years breast height age. It is based on the age and height of the tallest trees in the stand. Site index is derived from the age and height, estimated SI is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX #

SI is estimated when subalpine fir trees cannot present, e.g. young forest stands. It is determined by site series and ecosystem information. The estimated SI is derived from a Inventory Type Group and SI Estimated source code.
