4d SITE INDEX

Site index is the average tree height at a specific age. Usually breast height age. It is based on the age and height of the dominant and co-dominant trees. Site index is estimated by using site curves and height estimated to the nearest decimetre (0.1 metre).

4e. ESTIMATED SITE INDEX

Site index is estimated using site curves and height measurement, eg. preceded by (SI=20.0). It is estimated to a level which always underestimates the actual site index. Site index is estimated to the nearest decimetre (0.1 metre).
