4d SITE INDEX

Site index is the expected mean tallest tree achieved at 50 years breast height age. SI is based on the age and height of free growing species. When an accurate SI cannot be obtained from local information the SI value is estimated from the Site Guide.

4e. ESTIMATED SITE INDEX

An estimated site index is based on the site animal present, e.g. young stands (<30yrs). It is denoted by a dash which always follows the species code. Site index data base are incationy Site Guide and SI estimate source used.
