4d SITE INDEX

All SI are shown to the nearest metre referenced at 50 years.
Site Index is the height of the dominant trees of the most common leading species. When an accurate SI is not be obtained from age and height, estimated SI is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX

SI is estimated when suitable SI trees are not present, e.g. recent clearcut, or SI trees are too young to be accurate. Estimated SI precedes it. Associated fields in the data base are Inventory Type Group and SIE estimated source code.
