4d SITE INDEX

All SI are shown to the nearest metre referenced at 50 years.
Site Index is the height in metres that the dominant trees in a stand will attain in 50 years. Height is measured from breast height, which is an accurate SI cannot be interpolated from age and height, estimated SI is shown after, or replaces the SI.

4e: ESTIMATED SITE INDEX

SI is estimated when suitable SI trees are not present, e.g. recently harvested stands. The SI is derived from the Site Index Estimates by Ecosystem Classification Tables in the data base as Inventory Type Group and SI Estimated source code.
