4d SITE INDEX

SI is an estimate of the dominant trees referenced at 50 years. Site trees are chosen by the species most significant in the leading species. When an accurate SI cannot be obtained from local information, a default value is used from the table below.

4e: ESTIMATED SITE INDEX

SI is estimated using ecological information where almost present e.g. biogeoclimatic ecosystem classification (BEC) is used to select simply processes it. Associated fields in the data base are inventory type Group and SI estimated source code.
