4d SITE INDEX
Site index is the expected metre achieved at 50 years at its dominant height based on the age and height of the leading species. When an accurate SI cannot be obtained from site curves, an estimate is made based on the site series.

4e. ESTIMATED SITE INDEX
SI is estimated when suitable SI curves are not present, e.g. SI is estimated for non-forested polygons. Each estimate is recorded with a source code which always provides it. Associated fields in the data base are Inventory Type Group and SI Estimated Indicator.
