4d SITE INDEX

SI is determined by reading marks witnessed at 50 years Breast Height Age. SI is based on the age and height of the dominant and co-dominant trees. Site index is recorded to the age and height, estimated SI is shown after or replaces the SI.

4e. ESTIMATED SITE INDEX

SI is determined when conifers aren't present, e.g. young stands (<50yrs). It is decided by a stack which always has conifers present (Fd/Cw/Hw). SI is from the Inventory Type Group and SI Estimated source code.
