4e SITE INDEX

All SI are shown to the nearest metre referenced at 50 years.
Site Index is the height of the dominant trees of the main site forming species. When an accurate SI cannot be obtained from age and height, estimated SI is shown after, or replaces the SI.

4e ESTIMATED SITE INDEX

SI is estimated when suitable SI trees were present, e.g. immediately adjacent to the cut block, but which always precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
