4d SITE INDEX

All SI are shown to the nearest metre referenced at 50 years
Site Index is the height of the dominant trees at 50 years of the leading species. When an accurate SI cannot be obtained from age and height, estimated SI is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX

SI is estimated when suitable SI trees arenot present; e.g. immature stands. The species for which the SI is estimated always precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
