4d SITE INDEX

All SI are shown to the nearest metre referenced at 50 years breast height age. SI is the average height of the 100 largest trees per hectare of the leading species. When an accurate SI cannot be obtained from age and height, estimated SI is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX*

SI is estimated when suitable SI trees cannot present, e.g. young stands, stands with a lack of site trees, stands which always provides it. Associated fields in the data base are inventory Type Group and SI Estimated source code.
