4d SITE INDEX

Trees are sampled on the nearest metre witnessed at 50 years from the ground line. SI is based on the age and height of the leading species. When an accurate SI cannot be obtained from age and height combinations a broad site class is assigned like SI.

4e ESTIMATED SITE INDEX

Estimated site index is based on existing vegetal present, e.g. young trees, shrubs, herbs. SI is recorded to a site curve which always precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
