4d SITE INDEX
Is the average height of the dominant trees achieved at 50 years Breast Height Age. SI is based on the age and height of the dominant trees in the stand. Site index is a way of relating tree size with age and height, normalized SI is listed either on leading tree SI.

4e. ESTIMATED SITE INDEX
SI is estimated when available SI trees cannot be found, e.g. young stands (<30yrs). It is denoted by a slash which always follows the estimated site index value. The species and Inventory Type Group and SI Estimated source code.
