4d SITE INDEX

4d SI are derived by site scarred trees referenced at 50 years breast height age. Site index curves are species specific for leading species. When an accurate SI cannot be obtained from the above methods, estimates are made on moisture and nutrient regimes.

4e. ESTIMATED SITE INDEX

SI is estimated when scarred trees are not present, e.g. young stands. Estimates are based on ecological units. Primary provides 4- Associated fields in the data base are Inventory Type Group and SI Estimated source code.
