4d SITE INDEX
Site index is the average dominant trees referenced at 50 years breast height age. SI is based on the age and height of the leading species. When an accurate SI cannot be obtained from the site index curves, estimates are made from ecological data.
(ministryofforests.ca)

4e. ESTIMATED SITE INDEX
Estimated site index is the average dominant trees stand present, e.g. young stands (<30yrs). If a stand height is a mean which always precedes it. Associated fields in the data base are inventory estimates based on ecological data.
