4d SITE INDEX

50 is a common site index value. Site index is the expected height of the tallest trees in a stand at breast height age. It is based on the age and height of the dominant trees. Site index curves for the species listed in the table have been developed. Site index is always referenced to a stand age of 50 years, even though the trees may not have reached breast height at 50 years. If a stand is younger than breast height age, the site index curve is used to estimate what the stand height will be at breast height age. The estimated stand height is shown after, or replaces the SI.

4e ESTIMATED SITE INDEX

SI is estimated when access to trees is not present, e.g. young stands (<20y/o). It is denoted by a slash which always precedes the SI value. Estimated SI is derived from the Inventory Type Group and SI Estimated source code.
