4d SITE INDEX
Site index is the average dominant tree height at 50 years breast height age. SI is based on the age and height of the leading species. When an accurate SI cannot be obtained from age and height, estimated SI is shown after, or replaces the SI.

4e. ESTIMATED SITE INDEX
Estimated site index is the site index that would be present, e.g. where stand density is reduced by a death event. Usually precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
