4d SITE INDEX

All SI are known to the nearest metre referenced at 50 years breast height age. SI is based on the age and height of the dominant trees. The species and SI can be obtained from age and height; estimated SI is shown after, or replaces the SI.

4e ESTIMATED SITE INDEX

SI is estimated when actual site information is absent present, e.g. on non-forest lands (>70y no). It is identified by a slash which always precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
