4d SITE INDEX
SI is the average tree height reached by trees in the stand at 50 years breast height age. SI is based on the age and height of the leading species. When an accurate SI cannot be obtained from age and height, estimated SI is shown after, or replaces the S1.

4e. ESTIMATED SITE INDEX
SI is estimated when stands or trees are not present, e.g. young islands (<3.0m). It is denoted by a slash which always precedes it. Associated fields in the data base are Inventory Type Group and SI Estimated source code.
